Gerald Arocena

CSCI E-97

Assignment 1, Fall 2019

<div align="center">ReadMe</div>

My program runs as per the instructions provided (make sure to navigate to the "src" folder before

running). I provided another script called "additional.script" with extra tests that showcase further

functionality of my implementation not touched on in "ledger.script". To run my implementation's

processCommand method instead of processCommandFile, no command line arguments should be

inputted when running it. My results from running "additional.script" and "ledger.script" (both in the

"src" folder) are in "results-additional.txt" and "results-ledger.txt" (in the GeraldArocena-Assignment1

folder of my directory structure), respectively. I also included an empty script file ("empty.script") to test

for when processCommandFile is processing on an empty file. The results for that are short and are also

included (in "results-empty.txt").
